In the study, published online today in Current Biology, research team members looked at pelvic floor muscle biomechanics and other factors known to affect women's pelvic floor activity when they experience sexual intercourse. These results indicated that, compared with other women, women with a history of sexual intercourse had more frequent prolapsed cells, which are soft tissue cells that are part of the pelvic floor muscle and can damage pelvic walls, and less pelvic floor muscle strength, making them more vulnerable to damage during intercourse.
